BEIHANG UNIVERSITY · SOFTWARE ENGINEERING · PEER REVIEW

Responding to our SRS review

SecondHelping — campus food recovery. 38 review comments, our replies, and what will changed from SRS v1.1 to v1.2.

Team C · “The Debuggers”

November 2026

AGENDA · 10 MINUTES

Four parts

01 Overview

02 Key issues and how v1.2 fixes them

03 Pushback

04 Next steps

01 · How many comments, how severe, what we decided

02 · The 3 Severe issues, the new order lifecycle, measurable quality, other fixes

03 · 3 comments rejected and 6 partly accepted, with reasons

04 · What is done in SRS v1.2 and what code changes follow

01 · OVERVIEW

The review at a glance

38

review comments on SRS v1.1

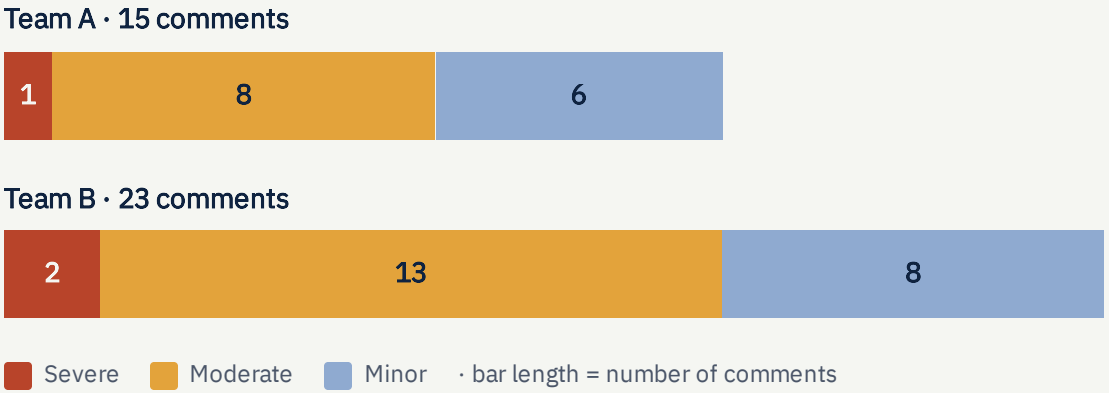

~25

distinct problems after merging overlaps

Every comment answered separately on GitHub, checked against both the SRS and the code. We thank both groups for their insightful reviews

01 · OVERVIEW

Most comments were Moderate

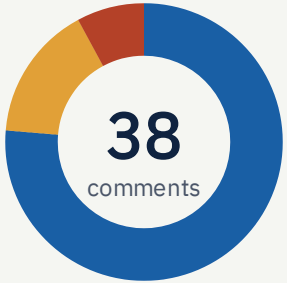

3

29
Accepted · 76%

6
Partly accepted · 16%

3
Rejected · 8%

Comments by SRS area

01 · OVERVIEW

Both teams found the same core problems

14/15

of Team A's comments were also raised by Team B.

Independent agreement told us which problems were real priorities.

Shared topic	Team A	Team B
Pickup code never verified	A-4	C08
No-show refund, order states	A-3	C04, C09
Unpaid orders hold stock	A-2	C02
Settlement needs user activity	A-5	C03
Quality targets not measurable	A-6	C05, C13
No test evidence	A-7	C16
AI not evaluated	A-1, A-9	C15
Security gaps	A-12	C01, C11

02 · SEVERE ISSUE 1 OF 3

Pickup confirmation never checked the code

Severe | Team B · C08 | Team A · A-4 | Accepted

BEFORE · V1.1 · REQ-FUNC-014

“A staff member can confirm pickup for an eligible order belonging to their own dining hall.”

The pickup code was generated, but never required. In the code, confirmation receives only the order ID.

Risk: a meal can be released to the wrong person.

AFTER · V1.2 · REQ-FUNC-014

- Staff enters the code the student shows
- Confirmed only if it matches a paid order of that hall, inside the pickup window
- Wrong, other-hall or used codes are rejected; nothing changes
- 5 wrong codes in 10 min → 5-min lockout
- The confirming staff member is recorded

02 · SEVERE ISSUE 2 OF 3

Plaintext passwords could survive forever

Severe | Team B · C01 | Team A · A-12 | Accepted

BEFORE · V1.1 · §2.3 VS REQ-FUNC-001

"Passwords must not be stored in plaintext" — but legacy accounts were only *"upgraded on their next successful login."*
An account that never logs in keeps its plaintext password. Our own seed script created the demo accounts that way.
Risk: the SRS contradicts itself.

AFTER · V1.2 · REQ-FUNC-001, REQ-NFR-08

- One-time migration hashes every remaining password before any deployment
- The seed script hashes passwords too
- A non-hashed stored value is treated as invalid
- No test-only exception
- Check: a query finds 0 non-hashed passwords

02 · SEVERE ISSUE 3 OF 3

Allergen answers from the chat assistant

Severe → we rate Moderate | Team A · A-1 | Partly accepted

BEFORE · V1.1 · REQ-FUNC-019

“Allergen-related questions exclude meals containing the stated allergens.”

The reviewer assumed the AI model decides. In fact the tool already filters in the database — the SRS just never said so.

Real gaps: unknown allergen names were silently ignored; no disclaimer; no test set.

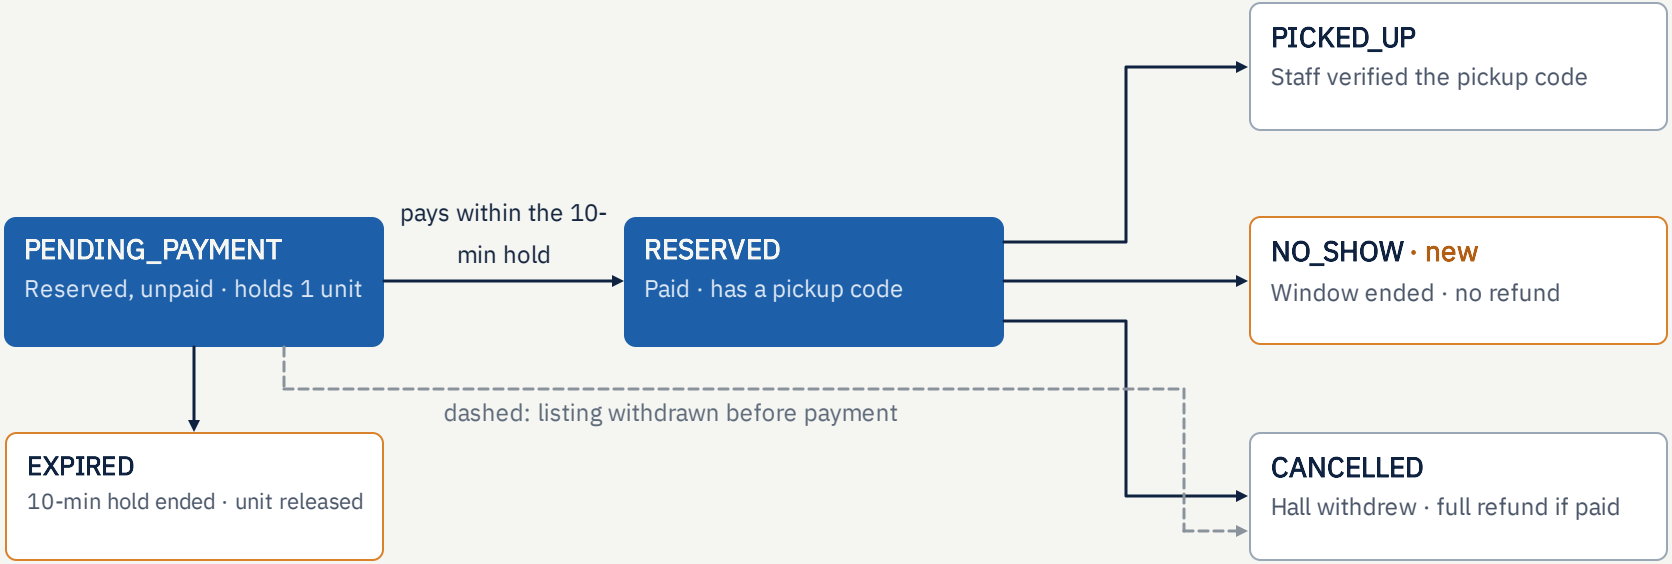

AFTER · V1.2 · REQ-FUNC-019, §3.6

- SRS states the database filter, not the model, excludes allergens
- Unknown allergen names are reported back to the user
- Never calls a meal “safe”; fixed disclaimer on every allergen answer
- 40-question test set, run 3×: 100% required on allergen cases

02 · FIXES 10 LIFECYCLE COMMENTS

One order lifecycle, every state defined

Blue = open order · White = final state · Orange edge = new in v1.2

02 · C05, C13, C15, C16 · A-6, A-7, A-9

From “acceptable” to numbers you can test

BEFORE · V1.1 §3.3

“within acceptable campus-scale response times”

“available during expected operating periods”

No IDs, no targets, no test evidence behind “Implemented”.

v1.2 requirement	Measurable target
REQ-NFR-01	Marketplace actions: 95% within 1.0 s at 20 users
REQ-NFR-02	Chat: 95% within 15 s; gives up after 60 s
REQ-NFR-05	99% uptime in opening hours; works with AI down
REQ-NFR-10	5 failed logins in 15 min → 15-min lock
§3.6 AI tests	Chat 40 questions ×3; images: 80% top-1 match

14 numbered REQ-NFR requirements. §4.1 gains Test ID, Date and Result columns; status says “verification pending” until a test passes.

02 · THE OTHER ACCEPTED COMMENTS

Smaller gaps, each closed in v1.2

Pricing and fees
Formula, rounding, ¥0.25 + ¥0.25 fees

Reminders
Max 2 per order, ±1 min

Roles
“Staff Member” everywhere; only students reserve

Data protection
PIPL, privacy notice, retention, deletion

Hardware
Reference machine for the local AI

Reporting
Term period and metric formulas

Allergens
Staff confirm; “not provided” label

Documentation
Diagrams, versions, ID mapping

03 · PUSHBACK

Where we disagreed, and why

Rejected · 3

C22 · Mark future modules “Won’t have”

Status “Planned” already excludes them; priority ranks the roadmap.

A-2 · Let students cancel

A cancelled closing bag rarely resells. The 10-min hold and order limit stop hoarding instead.

A-15 · Add a “Related” field

Requirements already cite each other by ID, and §4.1 traces them.

Partly accepted · 6

Comment	What we changed, and what we kept
A-1	Fixed the gaps; severity overstated
C07	ER diagrams existed; now linked, plus new diagrams
C12	Safety notice added; food rules belong to the hall
C14	Admin tools declared out of scope
C23	File list moved out; routes and states stay
A-14	Scheduler start was specified; hardware added

04 · REVISION PLAN

SRS v1.2 is written; the code follows

Oct 31 – Nov 2 · done

38 comments received in 10 issues

Nov 2 · done

Each claim checked; 38 replies posted

Nov 2 · done

SRS v1.2 written

Next

Implement 25 pending criteria

Then

Run tests; record evidence in §4.1

Code changes queued from the review

1 · Pickup-code check at confirmation

2 · 10-min payment hold and NO_SHOW state

3 · Settlement on the 1-minute scheduler

4 · Secret on the scheduler endpoint

5 · Password migration and hashed seed data

6 · Student-only reservations, 2-order limit

7 · Chat timeout and allergen disclaimer

8 · Login rate limiting

TEAM C · THE DEBUGGERS · BEIHANG UNIVERSITY

Thank you.

Questions?

Thanks to Teams A and B for careful, specific reviews.
